Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ATPIVX 902 bp DNA SYN 28-SEP-1992 Cloning vector pi-VX used for screening bacteriophage lambda gene libraries for specific DNA sequences in Escherichia coli. Probe sequences are inserted in the vector pi-VX. Contains a polylinker, and origin of replication (derived from pMB1) and a tyrosine amber-suppressor gene (synthetic supF gene).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Suppressor gene.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

HUMAN SERVICES

Plasmid pITL-1 comprises a base vector for novel humanised polynucleotide vectors. The vector in Escherichia coli DH 10-beta/PP is deposited as ATCC 98400. Novel vectors comprise a lubera/PP is deposited as ATCC 98400. Novel vectors comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site (see AAV21735-36) which accepts CDNA products from RT-PCR cloning. They also contain minmal non-human components, such as a replication origin (see AAV21715) and selectable matter gene (see AAV21717-18) that are necessary for production of the vector. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response in immune response in immune response to the traget sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as subjusted to the vectors. The target antigens are expressed as self polypeptides or peptides and appropriately presented on antigen presented. unised polynucleotide vectors – comprising human derived promoter sequence acceptance site, used for the production of vaccines presented on antigen presenting cells.                  used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and as such, presented on antigen presenting cells.

plasmid pITL-A comprises a base vector for novel humanised polynucleotide vectors. The vector in Escherichia coli DH polynucleotide vectors. The vector in Escherichia coli DH polynucleotide vectors. The vector in Escherichia coli DH 10-beta/P3 is deposited as ATCC 98401. Novel vectors comprise a humanalian target tissue and cells and a sequence acceptance site in mammalian target tissue and cells and a sequence acceptance site They also contain minimal non-human components, such as a replication or face AAV21715. They also contain minimal non-human components, such as a replication or file vector. The novel vectors are are necessary for production of the vector. The novel vectors are are non-replicating in mammalian cells but are capable of extended are non-replicating in mammalian cells but are capable of extended standividuals. The vectors selectively elicit immune response to the target sequences with little or no immune response to the carget sequences with little or no immune response to the target sequences with little or no immune response to the components of the vectors. The target antigens are to the other components of the vectors selectively elicit immune response are processed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately are presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GCCATAIGGIGAGFGGATGCCTTGACCCCAGGCGGGATGGGGGGAGACCTGTAGTCAGAG 300

This COS cell expression vector was constructed from pisV (Little et al., Mol. Biol. Med. 1:473-488 (1983)) by inserting a synthetic transcription unit between the suppressor tRNA gene and the SV40 origin. The transcription unit consisted of a chimeric promoter composed of human cytomegalovirus AD169 immediate early peromoter composed of human cytomegalovirus AD169 immediate early enhancer sequences fused to the HIV LTR -67 to (plus)80 sequences. A polylinker confg. BetxI sites separated by a 350bp stuffer was inserted immediately downstream from the polylinker were placed the SV40 small bownstream from the polylinker were placed the SV40 small early region polyadenylation signals derived from pSV2. The new vector, which forms part of the wider disclosure of the specification, was used in the cloning of the human CD2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TCCATAGGCTCCGCCCCTGACGAGCATCACAAAAATCGACGCTCAAGTCAGGTGGC

                    used in a novel immunoselection cloning method for cell surface antigen genes, e.g. human CD19 (see also AAT83856). This involves introducing CDNA fragments into the vector, transfecting mammalian cells in culture, maintaining the cells under conditions that allow antigen expression, exposing the cells to an antibody directed against the antigen, and recovering positive cells by contact with an immobilised antibody directed against the first antibody.
            Expression vector piH3 (AAT38557), deposited as ATCC 67634, can be
                                                                                                                                                                                                                                                                                                                                                                                                        469 ATCGAATTCTTTCGGACTTTTGAAAGTGATGGTGGTGGGGGAAGGATTCGAACCTTCGAA

                                                                                                                                                                                                                                                                                                    469 ATCGAATTCTTTCGGACTTTTGAAAGTGATGGTGGTGGGGGAAGGATTCGAACCTTCGAA 528
                                                                                                                                                                                                                                                                                                                Cloning of cDNA encoding cell surface antigen - useful for isolation of diagnostic and therapeutic proteins
                                                                                                  Vector piH3 (AAT14702) is a COS cell expression vector constructed from piSV by inserting a synthetic transcription unit between the suppressor tRNA gene and the SV40 origin. This novel vector allows the generation of very large mammalian expression libraries and yields large amounts of protein in mammalian host cells, resulting in efficient selection. Efficiency of library construction is comparable to that achieved with phage lambda, but the clones generated are easier to manipulate. A novel immunoselection cloning method was used to clone genes (see also AAT14703-04 and AAT14706-26) for cell surface antigens of human lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CCGCTGTAAAGTGTTACGTTGAGAAAGAATTCCTGCAGCCCGCCGCGTTGCTGGCGTTTT

                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of expression vector piH3, a COS cell expression vector constructed from piSV by inserting a synthetic transcription unit between the suppressor tRNA gene and the SyMThetic transcription unit between the suppressor tRNA gene and the SyMT origin. The vector can be used in a novel method for cloning cDNAs from mammalian expression libraries. The method is based on transient expression of an antigen in eukaryotic cells and immunoselection of cells expressing the antigen by adhesion to an antibody-coated substrate. The method is useful for the solation and molecular cloning of any protein which can be expressed and transported to the cell sufface membrane of a cukaryotic cell. It has been used to clone genes encoding cell surface antigens associated with mammalian T lymphocyte antigens cuch as CDL-53, LFA-3, LCAM-1, FCRI, TLisA and Leu8 (see AAV63442-63 and AAW80440-55). The invention provides high efficiency expression vectors, such as piH3, which allow the generation of very large mammalian expression libraries, and yield large amounts of protein in mammalian host cells, resulting in efficient selection. The cumunotherapeutic applications, including the diagnosis and immuner of immune mediated infections, diseases, and disorders of animals in colliding the diagnosis and animals and animals.
                                                                                                                                                                                                   New cloning vector and polylinker – based on existing sequences for efficient cloning and expression of mammalian cDNA(s), especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 2932 BP; 774 A; 699 C; 682 G; 777 T; 0 other;

The vector can be used in a novel method for cloning cDNAs from mammalian expression libraries. The method is cloning cDNAs from mammalian expression libraries. The method is bysical selection of cells expression to antigen in enkaryotic cells and contains and molecular cloning of any protein contains and contains and molecular cloning of any protein contains and molecular cloning of any protein contains contains and molecular cloning of any protein contains contains and contains a

The present sequence is that of COS cell expression vector plasmid piH3. The vector was constructed from piSV by inserting a synthetic transcription unit between the suppressor tRNA gene and the SV40 origin. The transcription unit consisted of a chimeric promoter composed of human cytomegalovirus AD169 immediate early connecter sequences fued to the HIV LRR +80 was inserted a polylinker. Immediately downstream from the LTR +80 was inserted a polylinker containing 2 BstXI sites separated by a 350 bp stuffer. The BstXI sites were flanked by XbaI sites, which could also be used to excise the insert. Downstream from the polylinker were placed the SV40 small tantigen splice and early region polyA signals derived compared in the vector can be used to construct large mammalian cDNA expression libraries. A new method for cloning cDNA encoding cell surface antigens is based upon transient expression of antigen in eukaryotic (e.g. COS) cells and physical selection of cells coated substrate such as a culture dish. The purified cDNA and the protein that it encodes are useful for imminodiagnostic and the protein transient expression of colls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasitic

The present sequence for expression vector piH3 is used to provide high level expression of human lymphocyte cell surface antigens in eukaryotic host cells. Another expression vector piH34 (AASO3174) eukaryotic host cells. Another expression vector piH34 (AASO3174) c. sequences (AASO3172, AASO3173, AASO3175-AASO3195) are described relating to the invention of a novel method of clohing cDNA relating to the invention of a novel method of clohing cDNA relating to the invention of a novel method of clohing cDNA relating to the invention of a novel method of clohing cDNA relating to the invention of a novel method of clohing cDNA relating controlly and or comparison and efficient construction of cDNA mino acide extracellular domain sequence (amino acide 1-134 quven in amino acide vertacellular domain sequence (amino acide genes and the CD28 cDNA sequence (AASO3175) is also new. The purified genes and the CD28 cDNA sequence (AASO3175) is also new. The purified genes and applications, such as in the diagnosis and treatment of immune-mediated capplications or disorders in animals and humans. Such diseases diseases, infections or disorders in animals and humans. Such diseases include immune deficiency diseases, diseases of immediate type of include immune deficiency diseases, diseases of immediate type of include immune deficiency diseases, diseases of immediate type of include immune deficiency diseases, diseases of immediate type of complete tisorders, plasame and other cell neoplasms, parasitic diseases, planelled clasorders, plasame and other cell neoplasms, parasitic diseases, continue and purify other antibodies and antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AGCTGGGCTGTGTGCACGAACCCCCGTTCAGCCCGACGCTGCGCCTTATCCGGTAACT 1008

The deletion in gag removes one or more nuclectides downstream of nuclectide 350 of the gag coding sequence. One or more accessory genes are absent from the non-primate lenturius genome or lack the tat gene but includes the leader sequences between the end of the 5' long terminal repeat (LTR) and the ArG of gag. The vectors, particles or cells transfected with either of these, are useful for the delivery of nuclectides of interest to a target site (i.e. gene therapy). The retroviral vector can be used as a delivery system. Alternatively, a non-retroviral expression vector, adenovirus or plasmid can be used as a delivery system for the retroviral vector are troviral vector. The retroviral vectors are capable of transferring genetic material to non-dividing or slowly dividing cells. Deletion of larger regions of the gag gene in Equine infectious anemia virus (EIAV) vectors is advantageous and leads to higher titers of viral vector being produced. Deletion of accessory genes permits vectors to be produced without the genes normally associated with disease in lentiviral (e.g. HIV) infections. The deletion of these genes also permits the vector to
